QUESTION 1

How does Oracle Database Service for Azure simplify cross-cloud deployments for customers?

A. By allowing customers to manually create cross-cloud deployments using the Intercon- nect

B. By providing more storage and computing resources than any other cloud service pro- vider

C. By offering more database types than any other cloud service provider

D. By using an automated service?ased approach for cross-cloud deployment

Correct Answer: D

Oracle Database Service for Azure (OracleDB for Azure) is an Oracle managed service delivering Oracle Database services in Oracle Cloud Infrastructure (OCI) directly to Microsoft Azure custom-ers through the OCI Azure Interconnect (a capability available between the two cloud environments in regions located around the world). OracleDB for Azure uses a service-based approach, and is an alternative to manually creating complex cross-cloud deployments using the Interconnect.

QUESTION 2

Which is a database service that CANNOT be provisioned in the Oracle Public Cloud?

A. Autonomous Database on Dedicated Infrastructure

B. Exadata Database Service on Shared Infrastructure

C. Autonomous Database on Shared Infrastructure

D. Exadata Database Service on Dedicated Infrastructure

Correct Answer: B

QUESTION 3

An organization has decided to implement a multicloud solution by using Microsoft Azure for their frontend data analytics applications and Oracle Cloud Infrastructure (OCI) for their backend Oracle Autonomous Data Warehouse. In this scenario, how can the organization ensure secure and low la-tency data transfer between the frontend applications and the backend data warehouse?

A. Use public internet connections to transfer data between Azure and OCI, encrypting the data in transit.

B. Establish a dedicated, private connection between Azure and OCI using Azure Ex- pressRoute and Oracle FastConnect.

C. Leverage a VPN Gateway to create an encrypted tunnel between Azure and OCI for secure data transfer.

D. Implement a hybrid cloud approach by integrating on-premises infrastructure with both Azure and OCI.

Correct Answer: B

In the question, frontend is in Azure and backend is in OCI. And the keywords are SECURE and LOW LATENCY data transfer.

Use public internet connections to transfer data between Azure and OCI, encrypting the data in transit - INCORRECT as this option won\'t provide LOW LATENCY data transfer (as it is us-ing public internet).

Leverage a VPN Gateway to create an encrypted tunnel between Azure and OCI for secure data transfer - INCORRECT as Site-to-Site VPN Connection won\'t provide LOW LATENCY data transfer as the connection traverses through public

internet. Implement a hybrid cloud approach by integrating on-premises infrastructure with both Azure and OCI - INCORRECT as there is no mention of on-premises environment in the question. This option is irrelevant here.

Establish a dedicated, private connection between Azure and OCI using Azure ExpressRoute and Oracle FastConnect - CORRECT as it provides a direct Interconnect between OCI and Microsoft Azure which in turn provides
