-  **800,000+** Satisfied Customers

### QUESTION 1

You configured a content modifier as follows: Action Create. Name: ProductID. Source Type: XPath. Source Value: //ProductID. Data Type: java lang string. After testing the content modifier, you receive an error message that contains the

following fragment:

java.lang.ClassNotFoundException java lang string. What caused the error message?

- A. Incorrect name
- B. Incorrect source value
- C. Incorrect source type
- D. Incorrect data type

Correct Answer: D

The error message is caused by an incorrect data type in the content modifier configuration. The data type should be `java.lang.String` instead of `java lang string`. The data type defines the type of the value that will be stored in the header or property of the message. It should match one of the supported Java classes, such as `java.lang.String`, `java.lang.Integer`, `java.lang.Boolean`, and so on. If the data type is not valid, a `java.lang.ClassNotFoundException` will be thrown. ### QUESTION 2

You want to publish a new API product to the API business hub enterprise. What is a requirement?

- A. At least two deployed API Providers
- B. At least one deployed API Proxy
- C. At least one deployed API Provider
- D. At least two deployed API Proxies

Correct Answer: B

To publish a new API product to the API business hub enterprise, you need at least one deployed API proxy as a requirement. An API proxy is an API that acts as an intermediary between an API provider and an API consumer. It can be used to add security, monitoring, caching, transformation, and other features to the API provider. An API product is a bundle of one or more API proxies that are grouped together for a specific business scenario or use case. To create an API product, you need to select one or more deployed API proxies from your API portal and provide some metadata, such as name, title, description, quota limits, and so on. Then you can publish your API product to the API business hub enterprise, which is a centralized platform for discovering, consuming, and managing APIs. ### QUESTION 3

What are target endpoints of an API? Note: There are 3 correct answers to this question.

- A. API provider
- B. API consumer
- C. Resources
- D. API proxy
- E. URL of original API

Correct Answer: ADE

The target endpoints of an API are the API provider, the API proxy, and the URL of the original API. The API provider is the system or application that exposes the interface and functionality of the API. The API proxy is the intermediary component that mediates the requests and responses between the API consumer and the API provider. The URL of the original API is the address that identifies the location and resource of the API. #### QUESTION 4

Where can you find more information about APIs, policies, and integrations?

- A. Cloud Integration capability within SAP Integration Suite
- B. Open Connectors capability within SAP Integration Suite
- C. SAP Business Accelerator Hub

Correct Answer: C

You can find more information about APIs, policies, and integrations in the SAP Business Accelerator Hub. The SAP Business Accelerator Hub is a central place where you can discover, explore, and consume pre-built integrations, APIs, and best practices for various business scenarios and industries. #### QUESTION 5

You use an APIKey for authentication in an HTTPS API call. In which part of the Content Modifier is the APIKey included?

- A. Message body
- B. Message header
- C. Attachment
- D. Exchange property

Correct Answer: B

To use an API key for authentication in an HTTPS API call, you must include the API key in the message header of the

content modifier step. The message header contains information related to the message, such as addressing, routing, or metadata. You can use the content modifier step to create or modify message headers using expressions or constants. The API key is typically passed as a value of a specific header field, such as Authorization or X-API-Key, depending on the API provider's requirements. You can use the Camel Simple Expression Language to access or construct the API key value from variables, properties, or system information.
